This is likely due to a large diff change value which causes your predicted profitability to turn negative in the future.

Diff change is used for the estimated future profits graph and break-even analysis.

[Aimersoft Video Converter For Mac](#)

The chart can operate in one of three views: Total Profits The Total Profits view predicts what your overall profitability will be in the future.. Can I disable it? The diff change factor can be disabled by either manually setting it to 0 or clicking a 'Use Diff Change' switch found below the graph and in the break-even analysis section.. The calculator also takes the changing difficulty (diff change) into account If the network difficulty is increasing quickly, this will greatly increase your break-even time.. What is this? The diff change is the rate at which the network difficulty is changing every month. [Download Bbedit For Mac Os X](#)

How is this calculated? Time to break-even is calculated by comparing your hardware cost (which you must enter below) to your predicted monthly profits and seeing how long until the initial hardware cost is paid off.. The diff change can be excluded from the calculation by toggling the 'Use Diff Change' switch.. If it is never, your break-even time has been calculated to be greater than 10 years.. What is this? The profitability chart can help you visualize your long term mining projections.. What is this?The Break-Even Analysis feature can help you predict how long it will take to become profitable for a given setup.. How is this value calculated? The diff change value is calculated by looking at the current difficulty and comparing it to the 12 hour moving average of the difficulty one month ago.. Bitcoin - for Next, deduct the maintenance + electricity fee of 0 0035 USD per 10 GH/s of SHA-256 and 0.. For smaller coins the diff change can sometimes be inaccurate due to a wildly fluctuating difficulty.
